MOP THE FLOOR AND SOLVE A MULTITUDE OF KITCHEN PROBLEMS

Restaurants, hotels and other food service facilities often experience sanitation problems associated with the accumulation of organic material not removed with traditional floor mopping products. These problems include fruit fly, drain fly, and other small filth-breeding fly infestations; plus greasy floors, noxious odors and slow drains.

Most floor cleaners are effective only on the surface that is actually mopped. They are ineffective in the hard-to-access corners, cracks and crevices, and have no ability to clean drains and drain lines.

BioMop is a general floor cleaner combined with a highly concentrated biological degrader. BioMop cleans the floor and removes hard-to-access organic material -- all in one step. After mopping, the unused mop water is poured into each drain to remove small-fly breeding sites, to reduce drain odors, and to improve the flow in slow drains.

BioMop can also be sprayed into problem areas that cannot be reached during regular mopping.

This one-step process insures that all of these kitchen problems will be addressed daily, and will decrease the labor and outside service costs incurred in dealing with these problems individually.

BioMop can replace the current floor cleaning product, or it can also be used as a biological rinse when another floor cleaning product is preferred.

The logo for BioMop features the word "BioMop" in a bold, blue, sans-serif font. The "Bio" is in a lighter blue, and "Mop" is in a darker blue. A red underline is positioned beneath the letters "o" and "p". A small "TM" trademark symbol is located at the bottom right of the "p".
